

ABSTRACT

The present invention provides a two-dimensional image forming apparatus which also functions as an illumination apparatus at a low cost, and enlarges the utilization range of a two-dimensional image forming apparatus to a great extent. In a two-dimensional image forming apparatus (10) which includes a light source (1), two-dimensional image forming parts (5a) to (5c), and an enlarging and projection part (6), a rotation mechanism (11) for rotating the light source so that the light emission direction is changed is provided, and the light emitted from the light source is taken out as an illumination light by changing the light emission direction of the light source.
